Oil Mist Extraction

As a specialist provider of oil mist extraction systems and solutions, FXS ensure the safety of your employees & workplace, by effectively capturing and controlling both harmful & damaging oil mist & oil smoke emissions.

Oil mist or oil smoke formed when cutting fluids are used for cooling and lubricating during various machining processes, creates serious health, environmental, & workplace safety issues. Our tailored solutions not only address these challenges but also contribute to a safer and more sustainable workplace.

Oil Mist Extraction

Key Considerations

When looking to replace, implement or upgrade any oil mist extraction system, ensure you:

- Consider the health & wellbeing of all employees.
- Improve your workplace safety & working environment.
- Provide oil mist extraction equipment that complies with current regulations.
- Invest in energy efficient extraction equipment to reduce operational costs.

To ensure your system complies with current COSHH regulations and HSE LEV Guidance (HSG258). FXS can arrange a free onsite appraisal of your current process.

Our experienced engineers can advise on effective improvements to current systems (if required) or guide you through the procurement of new LEV systems and equipment, capable of delivering the required level of control.

Services

New Systems

Design & Supply of new extraction systems

Upgrades

Upgrade of compliant extraction systems subject to survey

Survey

Free - no obligation site survey

Design

Specialising in energy efficient systems

Green Energy

Installation of extraction optimisation systems

Install

Efficient project management ensuring successful installations

Testing

Thorough Examination & Testing (TExT) of LEV Systems

Service

Tailored aftercare contracts that save you time and money

Breakdowns

Rapid & efficient breakdown service
